## **EXHIBIT A**

## Intertrust v. MS: JCCS Claim Chart

U.S. Patent No. 6,253,193, Asserted Claim 1

	<u>'193 Claim 1</u>	IT Construction	MS Construction
1.	1. A method comprising:	The claim contains no requirement of a VDE.	Claim as a whole: The recited method is performed within a VDE. (See item #86 for Microsoft's construction of VDE.)
2.	receiving a digital file including music,		
3.		secure: One or more mechanisms are employed to prevent, detect or discourage misuse of or interference with information or processes. Such mechanisms may include concealment, Tamper Resistance, Authentication and access control. Concealment means that it is difficult to read information (for example, programs may be encrypted). Tamper Resistance and Authentication are separately defined (see item #67 and item #27, respectively, below). Access control means that access to information or processes is limited on the basis of authorization. Security is not absolute, but is designed to be sufficient for a particular purpose.	secure: (1) A state in which all users of a system are guaranteed that all information, processes, and devices within the system, shall have their availability, secrecy, integrity, authenticity and nonrepudiation maintained against all of the identified threats thereto.  (2) "Availability" means the property that information is accessible and usable upon demand by authorized persons, at least to the extent that no user may delete the information without authorization.  (3) "Secrecy," also referred to as confidentiality, means the property that information (including computer processes) is not made available or disclosed to unauthorized persons or processes.  (4) "Integrity" means the property that information has not been altered either intentionally or accidentally.  (5) "Authenticity" means the property that the characteristics asserted about a person, device, program, information, or process are genuine and timely, particularly as to identity, data integrity, and origin integrity.  (6) "Nonrepudiation" means the property that a sender of information cannot deny its origination and that a recipient of information cannot deny its receipt.

## '193 Claim 1 ring information

## **IT Construction**

MS Construction

secure: see item #3 above

4. storing information associated with said digital file in a secure database stored on said first device, said information including at least one budget control

and

secure: see item #3 above

<u>budget</u>: Information specifying a limitation on usage.

control: Information and/or programming controlling operations on or use of resources (e.g., content) including (a) permitted, required or prevented operations, (b) the nature or extent of such operations or (c) the consequences of such operations.

budget: (1) A unique type of "method" that specifies a decrementable numerical limitation on future Use (e.g., copying) of digital information and how such Use will be paid for, if at all.

(2) A "method" is a collection of basic instructions, and information related to basic instructions, that provides context, data, requirements, and/or relationships for use in performing, and/or preparing to perform, basic instructions in relation

to the operation of one or more

electronic appliances.

control: (1) Independent, specialpurpose, Executable, which can execute only within a Secure Processing Environment (see below). (2) Each VDE Control is a Component Assembly dedicated to a particular activity (e.g., editing, modifying another Control, a userdefined action, etc.), particular user(s), and particular protected information, and whose satisfactory execution is necessary to Allowing (see below) that activity. (3) Each separate information Access (see below) or Use is independently Controlled by independent VDE

(4) Each VDE Control is assembled within a Secure Processing Environment from independently deliverable modular components (e.g., Load Modules (see below) or other Controls), dynamically in response to an information Access or Use Request.

Control(s).

(5) The dynamic assembly of a Control is directed by a "blueprint" Record (see below) (put in place by one or more VDE users) Containing control information identifying the exact modular code components to be

	'193 Claim 1 IT Construction MS Construction		
<u></u>	<u>'193 Claim 1</u>	IT Construction	
			assembled and executed to govern
			(i.e., Control) this particular activity
			on this particular information by this
			particular user(s).
			(6) Each Control is independently
			assembled, loaded and delivered vis-
1			à-vis other Controls.
			(7) Control information and Controls
		·	are extensible and can be configured
			and modified by all users, and
1		·	combined by all users with any other
		-	VDE control information or Controls
			(including that provided by other
			users), subject only to "senior" user
1		·	Controls.
1	· i		(8) Users can assign control
			information (including alternative
			control information) and Controls to
			an arbitrarily fine, user-defined
			portion of the protected information,
			such as a single paragraph of a
			document, as opposed to being
			limited to file-based controls.
			(9) VDE Controls reliably limit Use
			of the protected information to only
1		• •	authorized activities and amounts.
			For the purposes of the construction
			of "Control," a "Secure Processing
			Environment" is defined as: A
			Secure Processing Environment is
			uniquely identifiable, self-contained,
			non-circumventable, and trusted by
			all other VDE nodes to protect the
	,		availability, secrecy, integrity and
			authenticity of all information
			identified in the patent application as
			being protected, and to guarantee that
	·		such information will be accessed and
			Used only as expressly authorized by
			the associated VDE Controls, and to
			guarantee that all requested reporting
		·	of and payments for protected
•		· ·	information use will be made. A
			Secure Processing Environment is
			formed by, and requires, a Secure
			Processing Unit having a hardware
			Tamper Resistant Barrier
			encapsulating a processor and internal
ш			- cheapsnianing a processor and internal

4107	Claim 1	IT Construction	MS Construction
153	Claim 1		
			Secure memory. The Tamper Resistant Barrier prevents all unauthorized interference, removal, observation, and other Use of the information and processes within it.
			For the purposes of the construction of "Control," "Allowing" is defined as: Actively permitting an action that otherwise cannot be taken (i.e., is prohibited) by any user, process, or device. In VDE, an action is allowed only through execution (within a Secure Processing Environment) of the VDE Control(s) assigned to the particular action request, and satisfaction of all requirements imposed by such execution.
			For the purposes of the construction of "Control," "Access" is defined as: To satisfactorily perform the steps necessary to obtain something so that it can be Used in some manner (e.g., for information: copied, printed, decrypted, encrypted, saved, modified, observed, or moved, etc.). In VDE, access to protected information is achieved only through execution (within a Secure Processing Environment) of the VDE Control(s) assigned to the particular "access" request, satisfaction of all requirements imposed by such execution, and the Controlled opening of the Secure Container
			Containing the information.  For the purposes of the construction of "Control," a "Load Module" is defined as: An Executable, modular unit of machine code (which may include data) suitable for loading into memory for execution by a processor. A load module is encrypted (when not within a secure processing unit) and has an Identifier that a calling process must provide to be able to use the load module. A load module is combinable with other load modules,

	<u>193 Claim 1</u>	IT Construction	MS Construction
			and associated data, to form Executable Component Assemblies. A load module can execute only in a VDE Protected Processing Environment. Library routines are not load modules and dynamic link libraries are not load modules.
			For the purposes of the construction of "Control," a "Record" is defined as: A data structure that is a collection of fields (elements), each with its own name and type. Unlike an array, whose elements are accessed using an index, the elements of a record are accessed by name. A record can be accessed as a collective unit of elements, or the elements can
5	at least one conv	conv. To reproduce The	be accessed individually.
5.	at least one copy control,	copy: To reproduce. The reproduction must be usable, may incorporate all of the original item or only some of it, and may involve some changes to the item as long as the essential nature of the content remains unchanged.  control: see item #4 above	copy: (1) To reproduce all of a Digital File (see below) or other complete physical block of data from one location on a storage medium to another location on the same or different storage medium, leaving the original block of data unchanged, such that two distinct and independent objects exist.  (2) Although the layout of the data values in physical storage may differ from the original, the resulting "copy" is logically indistinguishable from the original.  (3) The resulting "copy" may or may not be encrypted, ephemeral, usable, or accessible.
			For the purposes of the construction of "Copy," a "Digital File" is defined as: A named, static unit of storage allocated by a "file system" and Containing digital information. A digital file enables any application using the "file system" to randomly access its contents and to distinguish it by name from every other such unit. A copy of a digital file is a separate digital file. A "file system" is the portion of the operating system

	<u>'193 Claim 1</u>	IT Construction	MS Construction
			that translates requests made by
			application programs for operations
			on "files" into low-level tasks that
			can control storage devices such as
			disk drives.
			control: see item #4 above
6.	said at least one	budget: see item #4 above	budget: see item #4 above
	budget control		
1. 1	including a budget	control: see item #4 above	control: see item #4 above
	specifying the		
1	number of copies	a budget specifying the number of	a budget specifying the number of
	which can be made	copies which can be made of said	copies which can be made of said

	'193 Claim 19	IT Construction	MS Construction
	19. A method comprising:	The claim contains no requirement of a VDE.	Claim as a whole: The recited method is performed within a VDE. (See item #86 for Microsoft's construction of VDE.)
39.	receiving a digital file at a first device;		
40.	establishing communication between said first device and a clearinghouse located at a location remote from said first device;	clearinghouse: A provider of financial and/or administrative services for a number of entities; or an entity responsible for the collection, maintenance, and/or distribution of materials, information, licenses, etc.	clearinghouse: (1) A computer system that provides intermediate storing and forwarding services for both content and audit information, and which two or more parties trust to provide its services independently because it is operated under constraint of VDE security.  (2) "Audit information" means all information created, stored, or reported in connection with an "auditing" process. "Auditing" means tracking, metering and reporting the usage of particular information or a particular appliance.
41.	said first device obtaining authorization information including a key from said clearinghouse;	clearinghouse: see item #40 above	clearinghouse: see item #40 above
42.	said first device using said authorization information to gain access to or make at least one use of said first digital file, including using said key to decrypt at least a portion of said first digital file; and	use: Normal English: to put into service or apply for a purpose, to employ.	use: (1) To use information is to perform some action on it or with it (e.g., copying, printing, decrypting, encrypting, saving, modifying, observing, or moving, etc.).  (2) In VDE, information Use is Allowed only through execution of the applicable VDE Control(s) and satisfaction of all requirements imposed by such execution.  For the purposes of the construction of "Use," "Allowed" is defined as set forth in item #4, above.
43.	receiving a first control from said	control: see item #4 above	control: see item #4 above

	d	<b>O</b> m	12

	<u>'683 Claim 2</u>	IT Construction	MS Construction
51.	2. A system including:	The claim contains no requirement of a VDE.	Claim as a Whole: The "system" is a VDE. (See item #86 for Microsoft's construction of VDE.)
52.	a first apparatus including,		
53.	user controls,	control: see item #4 above	control: see item #4 above
54.	a communications port,		
55.	a processor,		
56.			
56.	a first secure container	secure container: A container that is Secure.  In this definition, "container" means a digital file containing linked and/or embedded items.	secure container: (1) A VDE Secure Container is a self-contained, self- protecting data structure which (a) encapsulates information of arbitrary size, type, format, and organization, including other, nested, containers, (b) cryptographically protects that information from all unauthorized Access and Use, (c) provides encrypted storage management functions for that information, such as hiding the physical storage location(s) of its protected contents, (d) permits the association of itself or its contents with Controls and control information governing (Controlling) Access to and Use thereof, and (e) prevents such Use or Access (as opposed to merely preventing decryption) until it is "opened." (2) A Secure Container can be opened only as expressly Allowed by the associated VDE Control(s), only within a Secure Processing Environment, and only through decryption of its encrypted header. (3) A Secure Container is not directly accessible to any non-VDE or user calling process. All such calls are intercepted by VDE. (4) The creator of a Secure Container can assign (or allow others to assign) control information to any arbitrary portion of a Secure
		•	Container's contents, or to an empty Secure Container (to govern

	(602 CI : - 2	IT Company	NO.C.
<b> </b>	<u>'683 Claim 2</u>	IT Construction	MS Construction
-			(Control) the later addition of contents to the container, and Access to or Use of those contents).  (5) A container is not a Secure Container merely because its contents are encrypted and signed. A Secure Container is itself Secure.  (6) All VDE-protected information (including protected content, information about content usage, content-control information, Controls, and Load Modules) is encapsulated within a Secure Container whenever stored outside a Secure Processing Environment or secure database.
			For the purposes of the construction of "Secure Container," "Secure Processing Environment," "Load Module," "Access" and "Allow" are defined as set forth in item #4, above.
58.	containing a governed item,	containing: Normal English: having within or holding. In the context of an element contained within a data structure (e.g., a secure container), the contained element may be either directly within the container or the container may hold a reference indicating where the element may be found.	containing: Physically (directly) storing within, as opposed to addressing (i.e., referring to something by the explicitly identified location where it is stored, without directly storing it).
59.	the first secure container governed item being at least in part encrypted; the first secure container having been received from a second apparatus;	secure container: see item #57 above	secure container: see item #57 above

	'683 Claim 2	IT Construction	MS Construction

· · · · · ·	'721 Claim 1	IT Construction	MS Construction
-			
65.	1. A security	The claim contains no requirement of a VDE.	Claim as a whole: The recited
	method comprising:	a VDE.	method is performed within a VDE.
	•		(See item #86 for Microsoft's
			construction of VDE.)
66.	digitally signing a	digital signature: A digital value,	digitally signing:
	first load module	verifiable with a key, that can be used	(1) Creating a Digital Signature
	with a first digital	to determine the source and/or	using a secret Key (see below).
	signature	integrity of a signed item (e.g., a file,	(2) In symmetric key cryptography, a
	designating the	program, etc.).	"secret key" is a Key that is known
	first load module		only to the sender and recipient. In
	for use by a first	Digitally signing is the process of	asymmetric key cryptography, a
	device class;	creating a digital signature.	"secret key" is the private Key of a
			public/private key pair, in which the
1		designating: Normal English:	two keys are related uniquely by a
1		indicating, specifying, pointing out or	predetermined mathematical
		characterizing.	relationship such that it is
		use: see item #42 above	computationally infeasible to
		device class: A group of devices	determine one from the other.
		which share at least one attribute.	For the numbers of the same the
		which shale at least one attroute.	For the purposes of the construction
			of "Digital Signing," a "Key" is defined as: A bit sequence used and
			needed by a cryptographic algorithm
	·		to encrypt a block of plain text or to
			decrypt a block of cipher text. A key
		·	is different from a key seed or other
1			information from which the actual
			encryption and/or decryption key is
		·	constructed, Derived, or otherwise
	,		identified. In symmetric key
		•	cryptography, the same key is used
			for both encryption and decryption.
			In asymmetric or "public key"
			cryptography, two related keys are
i			used; a block of text encrypted by one
			of the two keys (e.g., the "public
.			key") can be decrypted only by the
			corresponding key (e.g., the "private
- 1		·	key").
		·	
	, .		digital signature: A computationally
1	4		unforgeable string of characters (e.g.,
			bits) generated by a cryptographic
I			operation on a block of data using
- }		Ì	some secret. The string can be
			generated only by an entity that
			knows the secret, and hence provides

'900 Claim 155	IT Construction	MS Construction
		(2) Secure Processing Environment: At each node where VDE-protected information is Accessed, Used, or assigned control information, VDE requires a Secure Processing Environment (as set forth in item #6).
	·	(3) <u>VDE Controls</u> : <b>VDE Allows</b> Access to or Use of protected information and processes only through execution of (and satisfaction of the requirements imposed by) <b>VDE Control(s)</b> .
	·	(4) <u>VDE Secure Container</u> : See construction of Secure Container (see item #57).
		(5) Non-Circumventable: VDE is non-circumventable (sequestered). It intercepts all attempts by any and all users, processes, and devices, to Access or Use, such as observing, interfering with, or removing) protected information, and prevents all such attempts other than as allowed by execution of (and satisfaction of all requirements imposed by) associated VDE Controls within Secure Processing Environment(s).
		(6) Peer to Peer: VDE is peer-to-peer. Each VDE node has the innate ability to perform any role identified in the patent application (e.g., end user, content packager, distributor, Clearinghouse, etc.), and can protect information flowing in any direction between any nodes. VDE is not client-server. It does not predesignate and restrict one or more
		designate and restrict one or more nodes to act solely as a "server" (a provider of information (e.g., authored content, control information, etc.) to other nodes) or "client" (a requestor of such information). All types of protected-content transactions can proceed without requiring interaction with any server.

<u>'900 Claim 155</u>	IT Construction	MS Construction
		(7) Comprehensive Range of Functions: VDE comprehensively governs (Controls) all security and commerce activities identified in the patent application, including (a) metering, budgeting, monitoring, reporting, and auditing information usage, (b) billing and paying for information usage, and (c) negotiating, signing and enforcing contracts that establish users' rights to Access or Use information.
·		(8) <u>User-Configurable</u> : The specific protections governing (Controlling) specific VDE-protected information are specified, modified, and negotiated by VDE's users. For example, VDE enables a consumer to place limits on the nature of content that may be <i>Accessed</i> at her node (e.g., no R-rated material) or the amount of money she can spend on viewing certain content, both subject only to other users' senior Controls.
•		(9) General Purpose; Universal: VDE is universal as opposed to being limited to or requiring any particular type of appliance, information, or commerce model. It is a single, unified standard and environment within which an unlimited range of electronic rights protection, data security, electronic currency, and banking applications can run.
		(10) Flexible: VDE is more flexible than traditional information security and commerce systems. For example, VDE allows consumers to pay for only the user-defined portion of information that the user actually uses, and to pay only in proportion to any quantifiable VDE event (e.g., for only the number of paragraphs displayed from a book), and allows editing the content in VDE containers while maintaining its security.

<u></u>	<u>'900 Claim 155</u>	IT Construction	MS Construction
			For the purposes of the construction of "VDE," "Secure Processing Environment" and "Access" are defined as set forth in item #4, above.
87.	a first host processing environment comprising	host processing environment: This term is explicitly defined in the claim and therefore needs no additional definition. It consists of those elements listed in the claim.  Without waiving its position that no separate definition is required, if required to propose such a definition, InterTrust proposes the following: a Protected Processing Environment incorporating software-based security.	host processing environment: (1) A processing environment within a VDE node which is not a Secure Processing Environment.  (2) A "host processing environment" may either be "secure" or "not secure."  (3) A "secure host processing environment is a self-contained Protected Processing Environment, formed by loaded, Executable programming executing on a general purpose CPU (not a Secure Processing Unit) running in protected (privileged) mode.  (4) A "non-secure host processing environment" is formed by loaded, Executable programming executing on a general purpose CPU (not a Secure Processing Unit) running in user mode.  For the purposes of the construction of "Host Processing Environment," a "Secure Processing Environment" is defined as set forth in item #4, above.
88.	a central processing unit;		dormed as set forth in item #4, above.
89.	main memory operatively connected to said central processing unit;		
90.	mass storage operatively connected to said central processing unit and said main memory;		

	VID COLOR OF A SECOND AND A SECOND ASSECTION AS				
	<u>'900 Claim 155</u>	IT Construction	MS Construction		
91.	said mass storage storing tamper resistant software				
	designed to be loaded into said main memory and	·			
	executed by said central processing unit, said tamper resistant software comprising:				
92.	machine check programming which derives information from one or more aspects of said host processing environment,	derives: Normal English: obtains, receives or arrives at through a process of reasoning or deduction. In the context of computer operations, the "process of reasoning or deduction" constitutes operations carried out by the computer.	derives: To retrieve from a specified source.		
		aspect: see item #60 above	aspect: see item #60 above		
		host processing environment: see item #87 above	host processing environment: see item #87 above		
0.2	one or man storage	derives information from one or more aspects of said host processing environment: Normal English, incorporating the separately defined terms: Derives (including creates) information based on at least one Aspect of the previously referred to Host Processing Environment.	derives information from one or more aspects of said host processing environment: (1) Deriving from the Host Processing Environment hardware one or more values that uniquely and persistently identify the Host Processing Environment and distinguish it from other Host Processing Environments.  (2) The "one or more aspects of said host processing environment" are persistent elements or properties of the Host Processing Environment itself that are capable of being used to distinguish it from other environments, as opposed to, e.g., data or programs stored within the mass storage or main memory, or processes executing within the Host Processing Environment.		
93.	one or more storage locations storing said information;				

	<u>'900 Claim 155</u>	IT Construction	MS Construction
94.	integrity programming which causes said machine	derive: see item #92 above compares: Normal English: examines	derive: see item #92 above  compares: A processor operation that
	check programming to derive said	for the purpose of noting similarities and differences. "Comparison" refers	evaluates two quantities and sets one of three flag conditions as a result of
	information, compares said information to	to the act of comparing.	the comparison – greater than, less than, or equal to.
	information previously stored in	·	
	said one or more storage locations, and		
95.	generates an indication based on the result of said comparison; and	comparison (compares): see item #94 above	comparison (compares): see item #94 above
96.	programming which takes one or more actions based on the state of said indication;		
97.	said one or more actions including at least temporarily halting further processing.		•

5. Patent No. 5,917,912, Asserted

	'912 Claim 8	IT Construction	MS Construction
98.	8. A process	The claim contains no requirement of	Claim as a whole: The recited method
	comprising the	a VDE.	is performed within a VDE. (See item
